

# **Testing The UI-DIF Formulas**

This paper was presented at the 2002 IRS Research Conference.

**Office Of Research  
Research, Analysis, And Statistics  
National Headquarters**

**May 1, 2002**

## Executive Summary

SB/SE requested this study to test quickly the usefulness of the UI-DIF Formulas. Unreported Income (UI) formulas were developed by the Office Of Research to identify returns with unreported income, not already identified by computer matches. Study results were requested within several months without relying on new exams. Studies relying on new exams require several years to complete and evaluate.

Eleven experts in unreported income classified 400 returns in eight activity codes. In each activity code, the experts classified 50 returns, 25 returns from the top two percent UI Scores and 25 returns from the bottom 50 percent UI Scores. All information about the UI Scores was shielded from the classifiers.

Each classifier answered the question, “Should The Return Be Examined For Unreported Income?”, ‘Yes’ or ‘No’. Responses were tabulated for each activity code. Conditions necessary to validate the UI Scores were as follows:

- (1) A strong association between ‘Yes’ and high UI Scores, and
- (2) A strong association between ‘No’ and low UI Scores.

Weak associations would fail to validate the UI Scores.

The frequency that classifiers recommended a return for audit defined an Audit Sum. Audit Sums (audit frequencies) validated the UI-DIF Formulas for each activity code. In each activity code, returns with high UI Scores were identified most often for audit, while returns with low UI Scores were identified least often for audit. Overall results were the sum of results for each activity code and follow for optimal Audit Sums:

### Overall Results From Optimal Audit Sums

UI SCORES	Unreported Income?		TOTAL
	YES	NO	
Top 2%	188	12	200
Bottom 50%	40	160	200
TOTAL	228	172	400

Overall, 188 of the 200 returns with high UI Scores were identified for audit, and 160 of the 200 returns with low UI Scores were accepted as filed. The associations were very high. UI-DIF Formulas were validated in each activity code tested. In each activity code tested, high UI Scores may justify probes for unreported income that might otherwise be prohibited.

High UI Scores could be used to select returns for examination. Classification in the field, however, is different than classification in this study. In the field, only returns with high UI Scores are classified and classification is by one classifier only. Field simulations suggested that UI-DIF Formulas are highly recommended for Nonfarm Business Activity Codes 535 to 537, are marginally recommended for Farm Business Activity Codes 538 and 539, and are not recommended for Nonbusiness Activity Codes 532 to 534, at this time.

## **Acknowledgments**

This study would not have been possible without the 11 experts in unreported income who gave generously of their time and talents. They are listed alphabetically (not by their classifier number), as follows:

Paula Henderson  
Richelle Jeffers  
Judith Jewett  
Helen Johnson  
Ray Joyce  
Edward Komacka  
Christie Lyons  
Edwin Marrero  
Mary McClamb  
Gabriel Navarro  
Nora Villarosa

The classification process was proctored and controlled by both Christina Rivera, SB/SE Compliance Policy, and by Lou Ann Sandoval, SB/SE Research in Denver. They enforced the research guidelines and they maintained the integrity of the study.

Returns were sampled, three-year facsimiles were printed, and documentation was provided quickly and expertly by Randy Mastenbrook and by Bob Buchwald of the MACS (Midwest Automated Compliance System) Development Center.

The UI-DIF Formulas were developed by Fred Cox, Eli Intrator, and Lance Asner, at the Detroit Computing Center with the assistance of Rick Griffith.

## **Background**

Unreported Income (UI) DIF Formulas<sup>1</sup> were developed by the Office of Research. The customer for UI-DIF Formulas is Centralized Workload Selection and Delivery, Compliance Policy, SB/SE.

UI-DIF Formulas were developed from the most recent TCMP Survey of Individuals<sup>2</sup>, and were developed for Activity Codes<sup>3</sup> 532 to 539. Activity Codes 530 and 531 were not included because they displayed too few sample returns with non-IRP unreported income, i.e. income not computer verified in the Information Returns Processing (IRP) program.

UI Formulas were developed using the DIF methodology, a proven technique for workload selection. Workload was defined as returns with non-IRP unreported income. Returns with high UI Scores are expected to yield unreported income much more often than returns with lower UI Scores.

High UI Scores may justify probes for unreported income that might otherwise be prohibited. Legislation enacted in RRA 98 stated, "The Secretary shall not use financial status or economic reality examination techniques to determine the existence of unreported income of any taxpayer unless the Secretary has a reasonable indication that there is a likelihood of such unreported income."<sup>4</sup> High UI Scores may satisfy this requirement to provide 'a reasonable indication that there is a likelihood of such unreported income'.

---

<sup>1</sup> The DIF methodology is a proprietary IRS enhancement of the statistical technique, Discriminant Function (DIF). DIF involves the intensive preprocessing of continuous data into wide intervals and a pooled covariance matrix.

<sup>2</sup> The III-10 TCMP Survey involved Tax Year 1988 Individual returns filed in Processing Year 1989.

<sup>3</sup> Individual returns are arranged by IRS among ten homogeneous, mutually exclusive exam classes. The ten exam classes define Activity Codes 530 to 539. Individual Activity Codes are defined in terms of Total Positive Income (TPI) on Forms 1040, 1040A, and 1040EZ and in terms of Total Gross Receipts (TGR) on Schedules C and F. Abridged definitions follow for Activity Codes 530 to 539:

<u>Nonbusiness</u>	530 – 1040A/EZ Type with TPI under \$25,000. 531 – 1040 Type with TPI under \$25,000 and TPI greater than TGR. 532 – 1040 Type with TPI \$25,000 under \$50,000 and TGR under \$25,000. 533 – 1040 Type with TPI \$50,000 under \$100,000 and TGR under \$25,000. 534 – 1040 Type with TPI \$100,000 and over, and TGR under \$100,000.
<u>Nonfarm Business</u>	535 – 1040 (C-TGR > F-TGR) with TGR under \$25,000 and TGR greater than TPI. 536 – 1040 (C-TGR > F-TGR) with TGR \$25,000 under \$100,000 and TPI under \$100,000. 537 – 1040 (C-TGR > F-TGR) with TGR \$100,000 and over.
<u>Farm Business</u>	538 – 1040 (C-TGR < F-TGR) with TGR under \$100,000 and TPI under \$100,000. 539 – 1040 (C-TGR < F-TGR) with TGR \$100,000 and over.

## **Study Plan**

The Office of Research developed the study plan that met SB/SE requirements to test the usefulness of UI Scores in several months, without new examinations. New return examinations require several years to complete and evaluate.

Eleven experts in unreported income classified 400 Individual returns with very high and low UI Scores. All information about the UI Scores was shielded from the classifiers. For each return, each classifier answered the question, “Should The Return Be Examined For Unreported Income?”, ‘Yes’ or ‘No’. ‘Yes’ and ‘No’ responses were tabulated and associated with high and low UI Scores. Two conditions were necessary to validate the UI Scores: (1) A strong association between ‘Yes’ and high UI Scores, and (2) a strong association between ‘No’ and low UI Scores. Weak associations fail to validate the UI Scores.

The study tested all eight UI Formulas (Activity Codes 532 to 539). For each activity code, 50 returns were classified, 25 returns with high UI Scores and 25 returns with low UI Scores. The 25 returns with high UI Scores were randomly selected from among the two percent of returns with highest UI Scores. The 25 returns with low UI Scores were randomly selected from among the fifty percent of returns with lowest UI Scores. The experts classified returns with no knowledge that UI Scores were involved in this study.<sup>5</sup>

Eleven experts in unreported income classified 400 returns (50 returns per activity code, for eight activity codes). In Phase 1, facsimile returns were classified for Tax Year 2000 and for the two prior years.<sup>6</sup> This paper is limited in scope to the Phase 1 results.

Phase 2 tested classification with facsimile returns, with case building tools,<sup>7</sup> and with original returns. Original returns may include line items not displayed on facsimile returns, as some line items were not transcribed during return processing. Phase 2 results are outside the scope of this paper.

## **Procedures For Collecting Data**

The research proposal for the UI Study was prepared by the Office of Research. The proposal included instructions for selecting the 400 sample returns and guidelines for data collection. Appendix E contains the research proposal for the UI Study.

Data was collected by two experienced researchers; (1) a representative of SB/SE Compliance Policy in DC (Rep-DC), and (2) a representative of SB/SE Research in Denver (Rep-Denver). The Rep-DC and Rep-Denver preserved the integrity of the UI Study by enforcing the following guidelines:

---

<sup>4</sup> The IRS Restructuring and Reform Act of 1998, Code Sec. 7602, “Examination Of Books And Witnesses”, (e), “Limitation On Examination On Unreported Income.”

<sup>5</sup> One-sample runs tests verified the random mix of the 25 high and 25 low UI Scores in each activity code.

<sup>6</sup> Facsimile returns for Tax Year 2000 and for the two prior years were printed by MACS (Midwest Automated Compliance System).

<sup>7</sup> Case building tools provide classifiers with related return information from IDRS and with third party information from CBRS and Choice Point.

1. The Rep-DC and the Rep-Denver were the **only** persons to communicate with the eleven classifiers on items pertaining to the UI Study.
2. Classifiers were instructed **NOT** to discuss the returns, the classification process, nor the study in general, with anyone other than the Rep-DC or the Rep-Denver. Communications about the study were public and were observed by all classifiers.
3. Each classifier was provided their own set of returns. Returns were classified in the same order for each activity code.
4. Classifiers independently reviewed each return and recorded if it should (or should not) be examined for unreported income. Results of classification were recorded on a scorecard. Appendix A contains a sample scorecard.
5. Classifiers were instructed to safeguard their scorecards. Whenever scorecards were not in use, they were collected and secured by the Rep-DC or Rep-Denver.
6. Completed scorecards were sent to the Office of Research for analysis and a report of findings.

### **Procedures For Treating Data**

#### **1. Classification By Experts**

Scorecards were used by the experts to classify the 50 returns in each activity code. Eleven experts generated 88 scorecards (11 scorecards for each of eight activity codes). Scorecards were tabulated and analyzed in two-by-two tables. Two-by-two tables displayed (1) counts of “Yes” and “No” unreported income, with (2) counts of high and low UI Scores. A statistical test of independence of classification<sup>8</sup> was applied to each table. Chi-Square was calculated, and when it was greater than 3.841, tables were statistically significant (i.e. the probability of such counts occurring randomly was less than five percent).<sup>9</sup>

Appendix B contains the responses of each classifier and their average responses for each activity code. Classifier responses were tabulated and tested for statistical significance in a two-by-two table, as in Figure 1.

---

<sup>8</sup> Charles T. Clark and Lawrence L. Schkade, Statistical Analysis For Administrative Decisions (Cincinnati: South-West Publishing Co., 1974), pp. 376-378.

<sup>9</sup> The statistical test of independence of classification follows:

1.  $H_0$ : Hypothesis - Responses of “YES” and “NO” to examine returns for unreported income were independent of High and Low UI Scores.
2.  $H_a$ : Alternative Hypothesis - Responses of “YES” and “NO” to examine returns for unreported income were associated with High and Low UI Scores at levels that were statistically significant.
3. A five percent probability if  $H_0$  occurring randomly requires a Chi-Square of 3.841. (one degree of freedom).
4. Criterion: Reject  $H_0$  (Accept  $H_a$ ) if Chi-Square > 3.841.

Reference: Clark and Schkade, loc. cit.

**Figure 1**  
**Activity Code 53X,**  
**Tabulation Of Classifier Responses**

UI SCORES	"YES" UI	"NO" UI	TOTAL
Top 2%	XX	XX	25
Bottom 50%	XX	XX	25
TOTAL	XX	XX	50

## 2. Classification By Majority Audit Sum

Returns were also classified by Audit Sum. An Audit Sum was the frequency with which the eleven classifiers recommended a return be examined for unreported income. The maximum Audit Sum was eleven; all eleven classifiers recommended auditing a return. The minimum Audit Sum was zero; no classifiers recommended auditing a return.

Appendix C contains classification by majority Audit Sums of six or more. Six or more classifiers were a majority. For each return, classification by Majority Audit Sum resulted in one of two outcomes; (1) audit the return if the Audit Sum was six or more, or (2) do not audit the return if the Audit Sum was five or less. Audit Sums were tabulated and tested for statistical significance<sup>10</sup> in a two-by-two table, as in Figure 2.

**Figure 2**  
**Activity Code 53X**  
**Classification By Majority Audit Sums GE 6**

UI SCORES	Audit Sum ...		TOTAL
	GE 6	LE 5	
Top 2%	XX	XX	25
Bottom 50%	XX	XX	25
TOTAL	XX	XX	50

<sup>10</sup> The statistical test of independence of classification follows for majority responses:

1.  $H_0$ : Hypothesis - Six or more Classifiers responding "YES" (to examine returns for unreported income) or "NO" (to accept returns as filed) were independent of High or Low UI Scores.
2.  $H_a$ : Alternative Hypothesis - Six or more Classifiers responding "YES" (to examine returns for unreported income) or "NO" (to accept returns as filed) were associated with High or Low UI Scores at levels that were statistically significant.
3. A five percent probability if  $H_0$  occurring randomly requires a Chi-Square of 3.841. (one degree of freedom).
4. Criterion: Reject  $H_0$  (Accept  $H_a$ ) if Chi-Square > 3.841.

Reference: Clark and Schkade, loc. cit.

### 3. Classification By Optimal Audit Sum Cutoff

Audit Sums were used as a scoring system. The 50 returns in each activity code were sorted by Audit Sums, highest to lowest, from Audit Sum 11 to Audit Sum zero. With no other information for return selection, one might logically select an Audit Sum cutoff of six; selection by a majority of classifiers. However, with UI Scores as additional information, the optimal Audit Sum cutoff was derived for each activity code.

Among the 50 returns in each activity code, 25 had high UI Scores and 25 had low UI Scores. If there were an association between UI Scores and Audit Sums, it should be evident at the Audit Sum cutoff that evenly split the inventory at about 25 returns. Audit Sum cutoffs could range from one to eleven. If classifiers, on average, selected 10 of the 50 returns for audit, the Audit Sum cutoff could be as low as one. On the other hand, if classifiers, on average, selected 40 of the 50 returns for audit, the Audit Sum cutoff could be as high as 11.

The optimal Audit Sum cutoff was determined using the Chi-Square statistic. At each alternative cutoff of one to eleven, Chi-Square was computed to measure the association above and below the Audit Sum cutoff with the number of high and low UI Scores. The cutoff with the greatest value of Chi-Square was defined as the optimal Audit Sum cutoff.<sup>11</sup>

Appendix C contains summary results for the alternative cutoffs of one to eleven. The cutoff with the largest value of Chi-Square in Appendix C is fully displayed in Appendix D, for each activity code.

## **Observations**

### 1. Average Responses

Appendix B contains the average responses of classifiers for each activity code. Average responses are summarized in Table 1.

In Table 1,<sup>12</sup> average responses varied widely by activity code grouping. Nonbusiness Activity Codes 532, 533, and 534, displayed the lowest number identified for audit. However, almost all the returns identified for audit had high UI Scores. Only 11 to 13 returns were identified for audit, while 9 to 12 of these returns displayed high UI Scores, on average.<sup>13</sup> The responses of all classifiers were statistically significant in Activity Code 532, ten were significant in Activity Code 533, and eight were significant in Activity Code 534.

<sup>11</sup> Chi-Square was applied similarly in segmentation modeling by the software package, CHAID (Chi-squared Automatic Interaction Detector), SPSS for Windows: CHAID, Release 6.0 (Chicago: SPSS Inc., 1993).

<sup>12</sup> In Tables 1, 2, and 3, two-by-two tables were displayed in a linear format for ease of viewing. The following mathematical relationships in Tables 1, 2, and 3, may not be apparent;

1. (Top 2% under YES UI) + (Top 2% under NO UI) = 25 for activity codes & 200 for total.
2. (Bot. 50% under YES UI) + (Bot. 50% under NO UI) = 25 for activity codes & 200 for total.
3. (YES UI Total) + (NO UI Total) = 50 for activity codes & 400 for total.

<sup>13</sup> Average values were rounded to whole numbers in the text to ease communication and understanding.

**Table 1**  
**Average Responses**

<u>Phase 1</u>	<u>"YES" Unreported Income</u>			<u>"NO" Unreported Income</u>			Chi-Square
Activity Code	Top 2% Scores	Bot. 50% Scores	Total	Top 2% Scores	Bot. 50% Scores	Total	
532	11.8	1.3	13.1	13.2	23.7	36.9	11.508
533	10.9	0.9	11.8	14.1	24.1	38.2	11.081
534	9.0	1.6	10.6	16.0	23.4	39.4	6.475
535	23.7	16.4	40.1	1.3	8.6	9.9	6.825
536	22.2	9.7	31.9	2.8	15.3	18.1	13.435
537	21.1	5.7	26.8	3.9	19.3	23.2	18.984
538	16.6	7.7	24.4	8.4	17.3	25.6	6.354
539	14.5	6.9	21.5	10.5	18.1	28.5	4.761
TOTAL	129.9	50.3	180.2	70.1	149.7	219.8	64.048

Nonfarm Business Activity Codes 535, 536, and 537, displayed the highest number of returns identified for audit, and, most noteworthy, this number included the bulk of returns with high UI Scores. Among Nonfarm Businesses, 27 to 40 returns were identified for audit, while 21 to 24 of these returns displayed high UI Scores, on average. The responses of eight classifiers were statistically significant in Activity Code 535, while the responses of all eleven classifiers were significant in Activity Codes 536 and 537.

Farm Business Activity Codes 538 and 539 displayed about half the 50 returns for audit, while about two-thirds of this number were returns with high UI Scores. In Activity Codes 538 and 539, the responses of only six of the eleven classifiers were statistically significant.

Total average responses were the sums of the average responses for each activity code. Overall, 130 returns of the 200 returns with high UI Scores were identified for examination, and 150 of the 200 returns with low UI Scores were accepted as filed, on average.

## 2. Classification By Majority Audit Sum

Appendix C contains classification by Majority Audit Sums for each activity code. Results are summarized in Table 2. Audit Sums were the numbers of classifiers that identified each return for audit. The majority Audit Sum was six or more classifiers, a majority of the eleven. Classification was statistically significant for each activity code.

In Table 2, classification by Majority Audit Sum varied widely by activity code grouping. Nonbusiness Activity Codes 532, 533, and 534, displayed the lowest number identified for audit. Only 7 to 12 returns were identified for examination. However, **all** of these returns displayed high UI Scores.

Nonfarm Business Activity Codes 535, 536, and 537, displayed the highest number of returns (28 to 43) identified for audit, and, most noteworthy, this number included **all** returns with high UI Scores. As a consequence, **all** returns identified as 'No UI' had low UI Scores.

Farm Business Activity Codes 538 and 539, displayed about half the 50 returns for audit, and about 75 percent of these were returns with high UI Scores.

Total results were the sum of results for each Activity Code. Overall, 142 returns of the 200 returns with high UI Scores were identified for examination, and 158 of the 200 returns with low UI Scores were accepted as filed.

**Table 2**  
**Majority Audit Sum GE 6**

<u>Phase 1</u>		<u>"YES" Unreported Income</u>			<u>"NO" Unreported Income</u>			Chi-Square
Activity Code	"YES" UI Audit Sums GE 6	Top 2% Scores	Bot. 50% Scores	Total	Top 2% Scores	Bot. 50% Scores	Total

537	6	25	3	28	0	22	22	39.286
538	6	19	6	25	6	19	25	13.520
539	6	19	5	24	6	20	26	15.705
TOTAL	N/A	142	42	184	58	158	216	100.644

### 3. Classification By Optimal Audit Sum Cutoff

Appendix D contains classification by the optimal Audit Sum cutoff for each activity code. Results are summarized in Table 3. The optimal cutoff was that with the greatest association between classification by Audit Sums and high and low UI Scores. The cutoff with greatest value of Chi-Square was optimal. Results were statistically significant for all activity codes.

In Table 3, classification by optimal cutoff did not vary widely by activity code grouping. Returns identified for audit varied from 24 to 36, of which 22 to 25 displayed high UI Scores. In every activity code, **almost all** the returns with high UI Scores were identified for audit.

Nonbusiness Activity Codes 532, 533, and 534, displayed the lowest optimal cutoffs of one and two; Nonfarm Business Activity Codes 535, 536, and 537, displayed the highest optimal cutoffs of seven to ten; and Farm Business Activity Codes 538 and 539 displayed intermediate optimal cutoffs of four and five.

Total results were the sum of results for each activity code. Overall, 188 returns of the 200 returns with high UI Scores were identified for examination, and 160 of the 200 returns with low UI Scores were accepted as filed.

**Table 3**  
**Optimal Audit Sums**

Phase 1		"YES" Unreported Income			"NO" Unreported Income			Chi-Square
Activity Code	"YES" UI Audit Sums GE ...	Top 2% Scores	Bot. 50% Scores	Total	Top 2% Scores	Bot. 50% Scores	Total	
532	2	22	2	24	3	23	26	32.051
533	2	24	2	26	1	23	24	38.782
534	1	25	11	36	0	14	14	19.444
535	10	22	6	28	3	19	22	20.779
536	8	25	3	28	0	22	22	39.286
537	7	24	0	24	1	25	26	46.154
538	5	22	7	29	3	18	21	18.473
539	4	24	9	33	1	16	17	20.053
TOTAL	N/A	188	40	228	12	160	172	223.419

## Conclusions

1. The UI-DIF Formulas were validated for Activity Codes 532 to 539.

The UI-DIF Formulas were validated in Table 3. In each activity code, returns with high UI Scores were identified most often for audit, while returns with low UI Scores were identified least often for audit. Returns with high UI Scores were almost identical to returns with high audit frequencies, and returns with low UI Scores were almost identical to returns with low audit frequencies.

NOTE: Operational classification in the field is different than classification by 11 experts in unreported income. Operationally, classification is by one classifier and only returns with high UI Scores are classified. Average results from returns with high UI Scores were most similar within activity code groupings. Activity code groupings follow;

Nonbusiness -	Activity Codes 532, 533, and 534
Nonfarm Business -	Activity Codes 535, 536, and 537
Farm Business -	Activity Codes 538 and 539

2. In Activity Codes 535, 536, and 537, high UI Scores were almost always selected for audit.

On average, classifiers identified for audit over 20 of the 25 returns with high UI Scores. Select rates ranged from 84 percent to 96 percent among average responses (Table 1) and were 100 percent for majority responses (Table 2) in each of the three classes. Such high select rates by experts in unreported income suggest acceptable rates by less experienced classifiers.

**Nonfarm Business Activity Codes 535, 536, and 537 were the best candidates for UI Scores.**

3. In Activity Codes 538 and 539, high UI Scores were often selected for audit.

On average, classifiers identified for audit over half the returns with high UI Scores. Select rates were 60 and 68 percent among average responses (Table 1) and were 76 percent for majority responses (Table 2) in each of the two classes. The moderate select rates by experts in unreported income suggest low to acceptable rates by less experienced classifiers.

**Farm Business Activity Codes 538 and 539 were marginal candidates for UI Scores.**

4. In Activity Codes 532, 533, and 534, high UI Scores were often accepted as filed.

On average, classifiers identified for audit less than half the returns with high UI Scores. Select rates ranged from 36 percent to 48 percent among average responses (Table 1) and from 28 percent to 48 percent for majority responses (Table 2). Such low select rates by experts in unreported income suggest even lower select rates by less experienced classifiers.

**Nonbusiness Activity Codes 532, 533, and 534 were the worst candidates for UI Scores.**

## **Recommendations**

1. Chief Counsel should be prepared to defend the UI Scores as “a reasonable indication that there is a likelihood of unreported income”, if UI Scores are intended to justify “financial status or economic reality examination techniques to determine the existence of unreported income.”<sup>14</sup>
2. Nonfarm Business Activity Codes 535, 536, and 537 are highly recommended for UI-DIF Formulas and for further testing. Nonfarm Business returns with high UI Scores were almost always classified for audit by experts in unreported income.
3. Farm Business Activity Codes 538 and 539 are marginally recommended for UI-DIF Formulas and for further testing. Farm Business returns with high UI Scores were usually classified for audit by experts in unreported income.
4. Nonbusiness Activity Codes 532, 533, and 534 are not recommended for UI-DIF Formulas, at this time, but are recommended for further testing. Nonbusiness returns with high UI Scores were usually accepted as filed by experts in unreported income.

---

<sup>14</sup> The IRS Restructuring and Reform Act of 1998, Code Sec. 7602, “Examination Of Books And Witnesses”, (e), “Limitation On Examination On Unreported Income”, states as follows:

The Secretary shall not use financial status or economic reality examination techniques to determine the existence of unreported income of any taxpayer unless the Secretary has a reasonable indication that there is a likelihood of such unreported income.

1.  $H_0$ : Average Classifier responses were independent of High or Low UI Scores.
2.  $H_a$ : Average Classifier responses were associated with High or Low UI Scores.
3. Random chance, no greater than 5%, requires a chi-square value of 3.841 or less.
4. Criterion: Reject  $H_0$  (Accept  $H_a$ ) at 5% if chi-square > 3.841.

1.  $H_0$ : Average Classifier responses were independent of High or Low UI Scores.
2.  $H_a$ : Average Classifier responses were associated with High or Low UI Scores.
3. Random chance, no greater than 5%, requires a chi-square value of 3.841 or less.
4. Criterion: Reject  $H_0$  (Accept  $H_a$ ) at 5% if chi-square > 3.841.

- H<sub>0</sub>: Six or more Classifiers responding "YES" (to examine a return for unreported income) were independent of High or Low UI Scores.
- H<sub>a</sub>: Six or more Classifiers responding "YES" (to examine a return for unreported income) were associated with High or Low UI Scores.
- Random chance, no greater than 5%, requires a chi-square value of 3.841 or less.
- Criterion: Reject H<sub>0</sub> (Accept H<sub>a</sub>) at 5% if chi-square > 3.841.

1.  $H_0$ : Six or more Classifiers responding "YES" (to examine a return for unreported income) were independent of High or Low UI Scores.
2.  $H_a$ : Six or more Classifiers responding "YES" (to examine a return for unreported income) were associated with High or Low UI Scores.
3. Random chance, no greater than 5%, requires a chi-square value of 3.841 or less.
4. Criterion: Reject  $H_0$  (Accept  $H_a$ ) at 5% if chi-square > 3.841.

## **Appendix E:**

### **Research Proposal For The UI Study**

## **Testing The Efficacy Of UI-DIF Formulas**

By Lance Asner

### **Background**

Unreported Income (UI) DIF Formulas were developed by the Office of Research. They were developed by the DIF Team, Studies And Modeling B (N:ADC:R:R:SDIB), for the Denver DORA, now under SB/SE. UI-DIF Formulas were developed from the most recent TCMP Survey of Individuals<sup>1</sup>, and were developed for Activity Codes 532 to 539. Activity Codes 530 and 531 were not included because they displayed too few returns with non-IRP unreported income.

UI Formulas were developed using the DIF methodology, a proven technique for workload selection. Workload was defined as returns with non-IRP unreported income. Returns with high UI Scores are expected to yield more unreported income than returns with lower UI Scores. High UI Scores can be used by market specialists to identify returns, many of which are expected to yield substantial unreported income.

High UI Scores may justify tests for unreported income that might otherwise be prohibited. Legislation enacted in RRA 98 stated, "The Secretary shall not use financial status or economic reality examination techniques to determine the existence of unreported income of any taxpayer unless the Secretary has a reasonable indication that there is a likelihood of such unreported income."<sup>2</sup> High UI Scores may satisfy this requirement to provide 'a reasonable indication that there is a likelihood of such unreported income'.

The customer for UI-DIF Formulas is Centralized Workload Selection and Delivery, Compliance Policy, SB/SE.

### **Study Plan**

SB/SE would like to test of the efficacy of UI Scores in several months, avoiding new exams. New exams require many years to complete and evaluate.

Experts in unreported income will classify returns with very high and low UI Scores. All information about the UI Scores will be shielded from the classifiers. Classifiers will screen returns and designate each return as either "Should Be Examined For Unreported Income" or "Should Not Be Examined For Unreported Income." Results will be tabulated and associated with the UI Scores. Two conditions are necessary to validate the efficacy of UI Scores: (1) A strong association between high UI Scores and "Should Be Examined For Unreported Income", and (2) a strong association between low UI Scores and "Should Not Be Examined For Unreported Income". Weak associations invalidate the UI Scores.

---

<sup>1</sup> The III-10 TCMP Survey involved Tax Year 1987 Individual returns filed in Processing Year 1988.

<sup>2</sup> The IRS Restructuring and Reform Act of 1998, Code Sec. 7602, "Examination Of Books And Witnesses", (e), "Limitation On Examination On Unreported Income."

The study will test all eight UI Formulas. For each activity code, 50 returns will be classified, 25 returns with high UI Scores and 25 returns with low UI Scores. The 25 returns with high UI Scores will be randomly selected from among the two percent of returns with highest UI Scores. The 25 returns with low UI Scores will be randomly selected from among the fifty percent of returns with lowest UI Scores. Experts will classify the returns (with origin unknown) as either “Should Be Examined For Unreported Income” or “Should Not Be Examined For Unreported Income”.

Eleven experts in unreported income will classify 400 returns (50 returns per activity code, for eight activity codes). Returns will be displayed as MACS facsimiles and will include MACS facsimiles for two prior years. Expert classification will require one week. This is Phase 1. Phase 1 tests the efficacy of the UI-DIF Formulas.

Phase 2 tests classification with MACS facsimiles and with original returns. Original returns may include line items not displayed on MACS facsimiles, because they were not transcribed during return processing. The two phases will be as similar as possible.

Classifier recommendations to examine or not to examine returns will be cross tabulated with high or low UI Scores in two-by-two tables. Statistical tests of the independence of classification will be completed for each set of 50 returns.

## **Procedures**

The UI Study will be conducted and coordinated by two experienced researchers; (1) a representative of SB/SE Research in Denver (Rep-Denver), and (2) a representative of SB/SE Compliance Policy in DC (Rep-DC). The Rep-Denver and the Rep-DC will insure the integrity of the UI Study. The following procedures will be observed:

1. Returns will be selected for classification at the MACS Development Center. “Return Selection For Classification” appears in the Appendix.
2. The Rep-Denver and the Rep-DC are the **only** persons who will communicate with the Classifiers during the study.
3. Classifiers will be instructed **NOT** to discuss the returns, the classification process, nor the study in general, with anyone other than the Rep-Denver or the Rep-DC. Communications about the study should be public and observed by all Classifiers.
4. Eleven (11) classifiers will be selected for their experience with unreported income in Activity Codes 532 to 539.
5. One set of Study returns will be prepared for each Classifier. Study returns will be arranged in the same order for each activity code. Study returns will be classified in the same order by all Classifiers.
6. Classifiers will be instructed to safeguard their scorecards. Whenever scorecards are not in use, they will be collected and secured by Rep-Denver or Rep-DC.

### Security

The UI Formulas are available on a ‘need-to-know’ basis. The formulas and related materials must be safeguarded at all times; they will be stored and locked in IRS containers when not in use. UI Formulas will be provided to MACS, and all materials associated with the UI Formulas will be destroyed at the conclusion of this study.

### Scorecard

A scorecard summarizes one expert classifying 50 returns (one activity code). The UI Study involves 88 scorecards (11 scorecards per activity code for eight activity codes). Experts record whether returns should or should not be examined for unreported income. The Rep-Denver and Rep-DC will insure that scorecards are completed independently. They will secure the scorecards when classification is not in progress. Scorecards will be sent to the DIF Team for tabulation and analysis. A sample scorecard template follows:

## Unreported Income Study (Phase 1)

Activity Code:

Should The Return Be Examined

Classifier:

For Unreported Income?

<u>Seq#</u>	<u>TIN</u>	<u>YES</u>	<u>NO</u>
1	xxxxxxxx		
2	xxxxxxxx		
3	xxxxxxxx		
4	xxxxxxxx		
5	xxxxxxxx

50		XXXXXXXXXX				

### **Scorecard Tabulation**

Completed scorecards will be analyzed by the DIF Team of the Office Of Research. Software macros will be developed to quickly complete the following:

1. Tabulation - Each scorecard will be tabulated as a two-by-two table.

### **CLASSIFICATION**

<u>UI Score</u>	<u>"YES" UI</u>	<u>NO" UI</u>	<u>TOTAL</u>
Top 2%	XX	XX	25
<del>Bottom 50%</del>	<del>XX</del>	<del>XX</del>	<del>25</del>
TOTAL	XX	XX	50

2. A two-by-two Average Table will be developed for each activity code. For each activity code, the four intersections will be averaged across the 11 two-by-two tables.
3. A two-by-two Consensus Table will be developed for each activity code. Each return will be categorized by the **majority** of expert votes as either 'YES' UI or 'NO' UI.
4. A statistical test of independence of classification<sup>3</sup> will be completed for each of the two-by-two table, as follows:
  - (1)  $H_0$ : Hypothesis - Responses of "YES" and "NO" to examine returns for unreported income were independent of High and Low UI Scores.
  - (2)  $H_a$ : Alternative Hypothesis - Responses of "YES" and "NO" to examine returns for unreported income were associated with High and Low UI Scores at levels that were statistically significant.
  - (3) A five percent probability if  $H_0$  occurring randomly requires a chi-square of 3.841. (one degree of freedom).
  - (4) Criterion: Reject  $H_0$  (Accept  $H_a$ ) if chi-square > 3.841.

### **Usefulness Of Each UI Formula**

Analyses will be prepared by the DIF Team, Office Of Research, to assist SB/SE evaluate the usefulness of each UI Formula.

## **Appendix**

### **Return Selection For Classification**

Returns will be selected for the study at the MACS Development Center, as follows:

1. Program the UI-DIF Formulas onto MACS.
2. For all TY 1999 Individual returns filed in PY 2000, extract the following fields for Activity Codes 532 to 539; (1) UI Score, (2) DIF Score, and (3) TIN.  
(create extract files AC-532 to AC-539)
3. Sort returns by 'UI Score', highest to lowest, for each activity code.
4. Create a new variable, 'Random1', from a random number generator, for each activity code.
5. Select the top two percent (2%) of returns with highest UI Scores in each activity code and sort by 'Random1', highest to lowest.
6. Select the 25 returns with the greatest values for 'Random1' in each activity code.  
Call the set of 25 returns for each activity code, the '25 high'.  
(create extract files H25-532 to H25-539)
7. Select the bottom fifty percent (50%) of returns with the lowest UI Scores in each activity code and sort by 'Random1', lowest to highest.
8. Select the 25 returns with the lowest values for 'Random1' in each activity code.  
Call the set of 25 returns for each activity code, the '25 low'.  
(create extract files L25-532 to L25-539)
9. Combine the '25 high' and '25 low' returns for each activity code.  
Call the set of 50 returns for each activity code, the 'combined 50'.  
(create extract files C50-532 to C50-539)
10. Create a new variable, 'Random2', from a random number generator, for the 'combined 50' in each activity code.
11. Sort the 'combined 50' by 'Random2', lowest to highest. Call these returns the 'random 50'. The 'random 50' identify the returns in each activity code and their arrangement for classification. Create a new variable, 'Sequence', numbering each return from one to 50. 'Sequence' will appear prominently on each facsimile return and corresponds to 'Seq #' on the scorecard.  
(create files R50-532 to R50-539)
12. Create an Excel workbook with eight spreadsheets, one for each activity code. Display the following items from the 'random 50' for each activity code; (1) 'Seq #', (2) 'Random 2', (3) 'UI Score', (4) 'Random 1', (5) TIN, and (6) DIF Score.  
Workbook will be sent to the DIF Team.
13. Order original returns of the 'random 50' in each activity code for Phase 2.

Generate MACS facsimile returns by Sequence Number for PY1999, prior year PY1998, and prior year PY1997, for the 'random 50' in each activity code for Phase 1.
